

# Sucking Catfish

*Gyrinocheilus aymonieri*

## Size

Up to 12cm in an aquarium, but can grow double this size in nature

## Natural range

Throughout Thailand

## Water

Not fussy, pH about 7.0

## Food

Will eat dry or frozen food, but prefers vegetable matter

## Comments

This peaceful fish is a popular algae eater, as it is so hardy.

A few sucking catfish in your aquarium will keep algae to a minimum. They constantly move over leaves, rocks and glass, grazing on algae and picking up particles of leftover fish food. Sucking catfish do not eat healthy aquatic plants but are quick to clean up any decomposing plant leaves.

Providing water quality is reasonable, this active fish will reward you with years of "algae eating" hard work.
