

Green Coral Goby

Gobiodon rivulatus

Background

Gobiodon's make lovely additions to the marine tank, especially if you have lots of Coral. The Green Coral Goby is a pretty example of Gobiodon, which are primarily scale-less. Instead of scales, their skin has a thick mucus coating which protects them from the Acropora Corals in which they live.

Water Quality

- Temperature: 24°C - 26°C.
- pH: 8.0—8.4
- SG 1.020 - 1.026

Feeding

Gobiodon can take some time to become accustomed to the home aquarium, as they can become stressed during transport. Upon arrival at home, ensure that they have plenty of live foods and extra attention until they settle in. Frozen or thawed foods can be offered, and Live Brine Shrimp will be well accepted.

Compatibility

Their toxic, mucus coated skin will offer some protection from tank mates, but they will still require careful matching. Species with which they can comfortably co-exist include Anthias, Blennies, Cardinals and other Gobies. Seahorses make particularly good tank mates. Gobiodon may also exist with Dwarf Angels and Butterflies.

Other species such as Damsels and Dottybacks are likely to harass and / or attack Gobiodon.

General Information

Rarely aggressive towards other species, they will fight with members of their own kind if housed in a too-small tank, so ensure that they have enough room.

Green Coral Goby will make a pretty addition to your tank, and are filled with character!
