

Snowflake Moray Eel

Echidna nebulosa

Maximum Size and Longevity

Up to 75cm

Water Quality

- Temperature: 24°C - 27°C.
- pH: 8.2
- SG: 1.020—1.026

Feeding

Snowflake Morays are predators and require meaty foods such as fresh and frozen fish, crustacean flesh and krill, using a feeding stick. Adult Snowflakes only require feeding 2—3 times per week, juveniles need more frequent feeding.

Compatibility

Snowflake Morays can be kept with other Morays, and are considered to be the most outgoing moray as they are commonly seen swimming out in the open. You should provide them with rocky lairs in which to hide and they will settle quickly into aquarium life.

They are peaceful towards tank mates that they don't see as a potential meal. They can be very aggressive during feeding time and have been known to latch on to other fish during the feeding frenzy.

General Information

The Snowflake Moray Eel is a tropical marine fish, that is hardy, and not extremely fussy about water conditions.

Because of the size to which they can grow, they require a minimum tank size of 120 litres.

As with other Eels, a tight fitting lid is essential to prevent them from escaping.

They also need powerful filtration because they are messy eaters and produce a lot of waste.
